

Health Information Toolkit Presentation

Tim Hickey

Problem

Colorectal cancer, also known as CRC, is one of the most commonly diagnosed cancers in men and women. This disease develops when abnormal cells grow uncontrollably in the colon and/or rectum. Due to the nature of CRC there is a stigma around it, causing people to be less likely search for treatment.

Solution

ColonAssist is a toolkit for people uncomfortable with talking to a doctor about CRC. The toolkit contains an at home stool screening kit as well as an instruction manual, a sheet of additional information, and an FAQ sheet.

Colon cancer can happen at any age. But most people with colon cancer are older than 50. The numbers of people younger than 50 who have colon cancer has been growing. Doctors don't know why. • Inflammatory bowel diseases. Conditions that cause pain and swelling of the intestines, called inflammatory bowel diseases, can increase the risk of colon cancer. These conditions include ulcerative colitis and Crohn's disease. • Not exercising regularly. People who are not active are more likely to develop colon cancer. Getting regular physical activity might help lower the risk. • Low-fiber, high-fat diet. Colon cancer and rectal cancer might be linked with a typical Western diet. This type of diet tends to be low in fiber and high in fat and calories. Research in this area has had mixed results. Some studies have found an increased risk of colon cancer in people who eat a lot of red meat and processed meat. • Family history of colon cancer. Having a blood relative who has colon cancer increases the risk of getting colon cancer. Having more than one family member who has colon cancer or rectal cancer increases the risk more.	FAQ <table><tr><th>Questions</th><th>Answers</th></tr><tr><td>• What is Colorectal Cancer?</td><td>• Colon cancer is a growth of cells that begins in a part of the large intestine called the colon.</td></tr><tr><td>• Besides a stool screening, what are the other screening options for detecting colorectal cancer?</td><td>• The standard screening test for colorectal cancer is colonoscopy, in which a flexible, lighted tube is used to examine the entire colon and rectum.</td></tr><tr><td>• What are some treatment options for patients with colorectal cancer?</td><td>• Surgery is the most effective treatment for colorectal cancer and operations for colorectal cancer are usually performed using minimally invasive techniques like laparoscopy and robotic surgery.</td></tr></table>	Questions	Answers	• What is Colorectal Cancer?	• Colon cancer is a growth of cells that begins in a part of the large intestine called the colon.	• Besides a stool screening, what are the other screening options for detecting colorectal cancer?	• The standard screening test for colorectal cancer is colonoscopy, in which a flexible, lighted tube is used to examine the entire colon and rectum.	• What are some treatment options for patients with colorectal cancer?	• Surgery is the most effective treatment for colorectal cancer and operations for colorectal cancer are usually performed using minimally invasive techniques like laparoscopy and robotic surgery.
Questions	Answers										
• What is Colorectal Cancer?	• Colon cancer is a growth of cells that begins in a part of the large intestine called the colon.										
• Besides a stool screening, what are the other screening options for detecting colorectal cancer?	• The standard screening test for colorectal cancer is colonoscopy, in which a flexible, lighted tube is used to examine the entire colon and rectum.										
• What are some treatment options for patients with colorectal cancer?	• Surgery is the most effective treatment for colorectal cancer and operations for colorectal cancer are usually performed using minimally invasive techniques like laparoscopy and robotic surgery.
